on VS code
And with the help of 'open with live server' using VS code
I can run this project it on firefox

I have created a website only
with the help of HTML. In
which only information is stored.
that what is my name, what
is my qualification, what is
my family background, what is
my achievement, etc.
It was very challenging for me
to make this project. as it was
my first individual project.
The only reason for making this
project was to implement my
theoretical knowledge practically.

I have created a < title > tag inside the
< head > tag, in which I have
written the name of the website.

I have used heading, menu, images,
paragraph, table, list, hyperlinks
inside the < body > tag.
Inside the < table > tag we have
created 7 menu items with the
Anchor tag to link them.
And all menu items are separated
with the help of < td > tag.
I have used < img > tag to embed
an image in a webpage. And inside the
< img > tag, I have set the
path of the image with the help

of src attribute.

With the help of anchor tag I have
link my school / college's image
to their original website.
In the footer, I have used some
icons like : Facebook, Instagram,
twitter etc. which are connected
to my account.

I have copied the link of some
social media icons from " Font awesome
icon" website and have done the
same in my website.

Challenges faces in your Project?

↳ I had not thought anything
about my project project in advance
due to which I was facing a
lot of hurdles.

How can you improve this project?

↳ First At first, I stopped to
create this project. Then I took 2-3
days to prepare my documentation
that what kind of website I want
to make, what tools will be
required in it.
In this way I colled collected
all the information after that
I started to create the
project again.

Dracoback of this Project?

The biggest dracoback of this project is that if a user want to talk with to me through my website, then he/she will not able to talk. Because I have not added my personal Id with contact menu.

Improvement in the Project?
